# KEY INFORMATION AND ENTRY REQUIREMENTS

	UCAS CODE	TYPICAL OFFER	REQUIRED SUBJECTS
<b>BSc Single Honours</b> Natural Sciences	CGF0	A*AA-AAB; IB: 38-34	GCE AL Maths ^ grade B and another from Physics, Chemistry or Biology at grade B; IB Maths HL5 and Physics, Chemistry or Biology HL5
<b>MSci Single Honours</b> Natural Sciences	FGC0	A*AA-AAB; IB: 38-34	GCE AL Maths ^ grade B and another from Physics, Chemistry or Biology at grade B; IB Maths HL5 and Physics, Chemistry or Biology HL5

^ candidates may offer GCE AL Maths, Pure Maths or Further Maths. Applicants achieving IB Maths SL7 plus IB HL5 in two from Physics, Chemistry or Biology will also be considered.

The full and most up-to-date information about Natural Sciences is on the undergraduate website at [www.exeter.ac.uk/ug/natural-sciences](http://www.exeter.ac.uk/ug/natural-sciences) and we strongly advise that you check this before attending an Open Day or making your application.

We make every effort to ensure that the entry requirements are as up-to-date as possible in our printed literature. However, since this is printed well in advance of the start of the admissions cycle, in some cases our entry requirements and offers will change.

## International students

If you are an international student you should consult our general and subject-specific entry requirements information for A levels and the International Baccalaureate, but the University also recognises a wide range of international qualifications. You can find further information about academic and English language entry requirements at [www.exeter.ac.uk/ug/international](http://www.exeter.ac.uk/ug/international)

For further details on our entry requirements, please see our Natural Sciences pages at [www.exeter.ac.uk/ug/natural-sciences](http://www.exeter.ac.uk/ug/natural-sciences)

## STREATHAM CAMPUS, EXETER

Website: [www.exeter.ac.uk/ug/natural-sciences](http://www.exeter.ac.uk/ug/natural-sciences)

Email: [naturalsciences@exeter.ac.uk](mailto:naturalsciences@exeter.ac.uk)

Phone: +44 (0)1392 724061

I like the multidisciplinary design of the programme and how it's based around Exeter's science strategy research themes, which is a great way to learn 21st-century science. The broad first year allows you to develop your interests, and then flexibility in future years allows you to forge your own pathway. The teaching has been excellent with lots of help in tutorial sessions and workshops.

Daniel Barlow, MSci Natural Sciences

# NATURAL SCIENCES

Contribute to our understanding of critical global issues and find solutions to the challenges they present

Develop skills required to excel in multidisciplinary science careers

Study with a community of internationally respected scientists

3-year BSc and 4-year research-focused MSci

£260 million investment in science, engineering and medicine

 The significant problems we face cannot be solved at the same level of thinking we were at when we created them.

Attributed to Albert Einstein

Finding solutions to the key challenges facing society, from an ageing population to climate change, requires a new scientific approach, inspired by a new generation of scientists.

Increasingly, the advances being made are taking place as the barriers between traditional subjects break down. This multidisciplinary approach relies on the application of core skills and knowledge from familiar scientific disciplines to new areas. For example, chemistry and mathematical thinking are meeting engineering concepts, and creating a whole new way of doing biology. Skills that have already solved big problems are now being harnessed in other contexts to tackle some of the grand challenges of the 21st century.

Our Natural Sciences degrees give you the opportunity to advance in the more traditional subjects, whilst also engaging with inspirational new areas of modern scientific innovation and research, such as mathematical and computational biology; biophysical, biochemical and

biomedical science; materials science and materials chemistry; the science of oceans, atmospheres and climate; astrophysics; and energy research.

Our challenging programmes demand that you think big. They demand that you think creatively. They have been developed for students who are not only bright and highly motivated, but also have open and enquiring minds and are able to think without constraints; those who have the potential to question convention. An 'everything is possible' mindset is essential.

The Athena SWAN Charter recognises and celebrates good employment practice for women working in Science, Technology, Engineering, Mathematics and Medicine (STEMM) in higher education and research. Find out more at [www.exeter.ac.uk/ug/athenaswan](http://www.exeter.ac.uk/ug/athenaswan)

# DEGREE PROGRAMMES

## Single Honours

### BSc and MSci Natural Sciences

Our Natural Sciences programmes uniquely put scientific research at their core, with the first two years designed to equip you with the skills and knowledge required to undertake a real research project in one of the University's research groups. We will explore the scientific concepts required to explain the natural world; from the properties of novel nano-materials such as graphene, to the richness of the living world, and to complex dynamic systems such as the Earth's climate.

You will develop an appreciation of scientific methodology and how scientific advances are made in the 21st century. You will interact with leading researchers in student-led seminars and workshops, undertake multidisciplinary group projects and, if taking the MSci programme, have the opportunity to undertake a semester abroad at one of our world-class partner universities.

The degrees ensure that you build solid foundations in the fundamentals of physical, biological and mathematical sciences and provide you with the flexibility to specialise in areas of specific interest as the programmes progress. They offer you the opportunity to switch between the three-year BSc programme and the four-year MSci programme as your interests and career aspirations develop.

The innovative design of the programmes, which expose you to contemporary science, is inspired and underpinned by some of the exciting and world-leading interdisciplinary research being carried out at the University of Exeter. These include:

- climate change and sustainable futures;
- systems biology;
- functional materials;
- extrasolar planets.

In the third year of the programmes you will have the opportunity to join a research group associated with these themes to undertake a real research project and contribute to cutting-edge science. For students continuing on the MSci, this project will be extended into the fourth year when you have the option to spend the majority of your time working on the project with the aim of publishing the results.

Our Natural Sciences programmes allow you to take full advantage of the growing demand in research organisations, industry and business for graduates who are able to work in the multidisciplinary scientific environments of the future.

## How your degree is structured

Our programme structure allows you to pursue your interests and shape your ambitions. The degrees are divided into core and optional modules, which gives you the flexibility to structure your degree according to your specific interests. Individual modules are worth 15, 30, 45 or 60 credits each and full-time undergraduates need to take 120 credits in each year.

Please note that modules may be subject to change. For up-to-date details of the programmes and modules, please check [www.exeter.ac.uk/natural-sciences](http://www.exeter.ac.uk/natural-sciences)

### BSc Natural Sciences

**Year 1** In your first year you will be introduced to the significant scientific challenges that inspire and permeate this programme. You will develop core knowledge in biology, chemistry, physics, mathematical modelling, computation and data analysis and, importantly, explore the connections between these different areas. Such an approach is fundamental to understanding interdisciplinary scientific issues in areas such as energy, forces and fields, matter and materials, complex dynamic systems and living systems.

At the heart of the programme is the *Frontiers in Science* module which runs through the first and second years. This is designed to enable you to bring together concepts from different disciplines, through a mixture of laboratory sessions, research seminars and workshops, with the aim of extending your understanding of fundamental scientific ideas. You will develop key skills such as scientific methodology and research report writing. In the seminars you will hear about current research from leading scientists and there will be opportunities to shape your activities in line with your interests.

The first-year modules have been designed specifically, and solely, for students of our Natural Sciences degrees. The modules are not intended to reproduce the science that you will previously have studied. Instead, we aim to ensure you are challenged intellectually, can build on your existing knowledge as well as broaden your understanding in other areas of science, and are perfectly placed to study any of the more advanced and specialist modules in your second year.

[Experimental Science](#)

[Foundations in Natural Science](#)

[Frontiers in Science I](#)

[Mathematics and Computing: Integrative Tools for Natural Sciences](#)

**Year 2** During your second year you will enhance the skills you've developed in the first year and deepen your knowledge across the fundamental sciences, whilst also starting to shape your individual route through the programme. You will continue to develop mathematical and computational skills that underpin 21st-century science and shape the remaining focus of your studies in subjects spanning biosciences, mathematics, engineering, physics, psychology, geography and sport and health sciences.

In addition to the 30 credit *Frontiers in Science I* core module, you should select six modules chosen from across the topic areas below, though students have the opportunity to undertake others outside of the programme, including a foreign language.

The optional modules are grouped into topic areas which reflect the interdisciplinary nature of much modern scientific research and which will lead naturally into the research you undertake in the third year. You will work closely with your tutor to tailor your studies to suit your developing interests, through careful choice of modules.

[Bioinorganic Chemistry](#)

[Genomics and Introductory Bioinformatics](#)

[Molecular Biology of the Gene](#)

[The Physics of Living Systems](#)

**Year 3** Third-year studies will build on your developing knowledge and interests from the first and second years and extend your high-level training in modern scientific skills. You will have a fantastic opportunity to gain experience of undertaking an independent research project related to one of the University's key interdisciplinary science research areas, such as: climate change and sustainable futures; functional materials; systems biology; and extrasolar planets. Within this framework you will determine the specifics of the research to suit your developing interests.

To complement your research project, you will also undertake a group project. Working in most modern environments requires highly developed team skills, and being an effective and cooperative member of the group will make you a valued employee. The group project will provide you with experience of working as part of a project team of five to eight individuals in a situation similar to one that you may find in many workplace settings. Finally, you will select three optional modules in order to build on and develop the core skills and knowledge you acquired during your second year.

---

Group Project

---

Research Project

---

## MSci Natural Sciences

**Years 1–3** See above under BSc Natural Sciences. In the third year, instead of studying the Group Project, you will have the option to spend a semester abroad plus study two optional modules in Exeter. Your time spent abroad will be assessed and you'll gain credits towards your final degree while also gaining vital experience and employability skills.

**Year 4** For students enrolled on the MSci, the final year provides an opportunity to continue the individual project started in the third year, working alongside leading scientists at the University. These mentors will provide the academic supervision to hone advanced technical laboratory research skills and analytical expertise. Research projects could, for example, be an exploration of the electronic properties of graphene, simulations of extrasolar planets, an investigation of the acoustic properties of lungs or the optical properties of cyano-bacteria. You will have the option to extend your project further with the aim of publishing your results in the scientific literature.

In your fourth year you will also select from a number of optional modules, through which you can explore other areas of interdisciplinary science and expand your ability to think at the frontiers of the scientific disciplines. Intensive two- or three-week problem-based learning modules will allow your scientific research, analysis and debating skills to be further developed. You must choose three or four optional modules from a wide selection of electives, dependent on those modules undertaken in previous years.

Descriptions of some examples of the optional modules available in years 3 and 4 are listed at the back of the brochure.

# LIVING SYSTEMS INSTITUTE

The Living Systems Institute (LSI) is a brand new, state-of-the-art building which will comprise over 7,500m<sup>2</sup> of high quality research laboratories and unique collaborative work spaces when it opens in autumn 2016.

It will house world-class facilities and bring together around 200 cell and molecular biologists, mathematicians, physicists, biomedical scientists and engineers, with an aim to revolutionise the diagnosis and treatment of diseases.

The LSI will facilitate novel, research-led teaching through our established undergraduate Natural Sciences programmes that recruit the very best students each year. As a result, you will become part of the next generation of scientists who can readily collaborate across wide disciplines to solve future problems.

For more information visit [www.exeter.ac.uk/livingsystems](http://www.exeter.ac.uk/livingsystems)

# LEARNING AND TEACHING

Our Natural Sciences degrees will place you at the heart of a community of internationally respected scientists, who are exploring some of the most important developments of the future and whose success in research is matched by their passion for teaching. We believe that every student benefits from being part of a research-inspired, challenging culture and being taught by experts – you will discuss the very latest ideas in seminars and tutorials. Our relationship with students is one of partnership and facilitation. For example, we will work with you to ensure that you reach the required level across physics, chemistry, biology, mathematics and computing over the first year. Staff and student enthusiasm results in the best possible undergraduate experience.

We use a wide variety of techniques and approaches to help you learn and get the most from your degree. Our teaching methods make full use of both traditional and contemporary approaches, including lectures, tutorials, laboratory sessions, study groups, problem-based project modules and web-based learning. Study groups will be an important aspect of enabling students from different backgrounds to gain a broad scientific background.

During core modules you will learn through practical work, problem-solving, project work, team work and research projects, all of which are designed to help you develop

analytical skills and scientific acumen: key qualities for success for the rest of your degree – and your future career. Working through examples, solving problems and developing your mathematical and analytical skills are a vital part of being a scientist, so coursework forms a component of most modules. Modules will have a reading list that will consist of chapters from textbooks and research articles from journals.

As a student of the programmes you will benefit from excellent student : staff ratios, small group tutorials and accessible staff. In all years you will be offered personal tutoring in small groups with an academic member of staff who you will see every week. You'll have at least 15 hours of direct contact time with your lecturers and tutors per week in your first year and will be expected to undertake extensive independent and self-motivated study as part of your degree. You should expect your total workload to average about 40 hours per week during term time. During your studies you will learn to work independently and become a scientific thinker – these skills are not easy to acquire but we will be on hand to guide you throughout the programme.

Alongside your academic studies you will develop personal skills, gaining expertise in communication, team working and project management and the ability to debate and reflect on the effects of new scientific developments on society and individuals.

Our aim is to teach a syllabus that you will find intellectually challenging, rewarding and stimulating. We are here to help you develop as a scientist so that you can make a real contribution to the exciting research taking place at the University of Exeter and to important scientific developments long after your graduation.

## Assessment

You will be assessed in all years through a variety of means; these will include coursework, exams, written reports or presentations, amongst others. You must pass your first-year assessment in order to progress to the second year, but the results will not count towards your degree classification and the assessment will not disadvantage students who did not study all science subjects at A level.

For full details of the assessment criteria for each module, check the relevant subject areas on our website at [www.exeter.ac.uk/ug/natural-sciences](http://www.exeter.ac.uk/ug/natural-sciences)

## Study abroad

If you study the MSci you will have the opportunity to study overseas for one semester at one of our world-class partner institutions. The semester abroad will be taken during your third year and will be assessed. Visit [www.exeter.ac.uk/ug/natural-sciences](http://www.exeter.ac.uk/ug/natural-sciences) for further information.

Having enjoyed all my A level subjects I simply could not choose between them and therefore Natural Sciences was the perfect choice due to its multidisciplinary nature. Natural Sciences offers not only breadth of study but also depth, and I have been able to expand and develop scientific knowledge as well as appreciate the importance of an interdisciplinary approach. To gain such understanding in multiple disciplines requires hard work and is challenging; however, I have felt fully supported in my studies. I was drawn to this course in particular due to the sense of community as a result of the relatively small number of students on the course, allowing strong relationships to form with both students and staff.

Laura Elliott, BSc Natural Sciences

# CAREERS

Globally, research in universities and institutions is increasingly being undertaken in truly multidisciplinary settings. As a graduate of the University of Exeter Natural Sciences programmes you will have the skills and expertise to make a significant impact in such a setting and to further your academic career by pursuing doctoral training should you choose.

Alternatively, you may wish to follow an alternative career path. The issues and challenges facing society are also rarely confined to a single scientific discipline, and government agencies draw upon expertise across different fields. Natural Sciences graduates will be ideally placed to not only pursue scientific careers within these organisations, usually starting in a graduate programme, but later to branch into project management, technical leadership and management.

In smaller companies, Research and Development (R&D) teams might only consist of a few people and scientists will often be expected to work across the traditional scientific disciplines, particularly with regards to the development of new products and services. Consultancy companies also work across traditional scientific careers and offer roles in project management, scientific software development

and mathematical modelling. Larger companies use multidisciplinary teams in research, development, consultancy and also in management activities such as strategy setting. Graduates from our Natural Sciences programmes will be well positioned to join large companies through their graduate recruitment programmes and to excel in these environments, progressing to the top of their chosen career path.

Employers highly value skills and attributes such as flexibility, the capacity to work as an individual or in a team, openness to new ideas, the ability to communicate complex ideas to different audiences, and passion, creativity and enthusiasm. Many employers look for graduates who can work across different disciplines to tackle some of the world's most challenging problems, whether in scientific research or industry and commerce.

Our Natural Sciences degree will not only provide you with a unique understanding of scientific global challenges facing our society, but will also help you to develop a wide range of key skills for employment and further study, such as analytical problem-solving, teamwork and organising and communicating information. Whether you choose to pursue a career in scientific research in academia or government, research

and development in industry, or a career in law (particularly intellectual property), business, management, or teaching, a University of Exeter Natural Sciences degree will make you highly attractive to employers and will open a wide range of career opportunities.

We have an excellent reputation with graduate recruiters and our students and graduates compete very successfully in the employment market. On campus we offer a careers advisory service which provides high quality careers information and guidance to all students as well as online facilities such as a CV creator and advice on application and interview techniques.

We also offer the Exeter Award and the Exeter Leaders Award. These schemes encourage you to participate in employability-related workshops, skills events, volunteering and employment which will contribute to your career decision-making skills and success in the employment market. Whatever path you want to follow after graduating, we're here to help and support you with all your career and employability needs.

For further information about what the careers service offers at Exeter visit [www.exeter.ac.uk/ug/careers](http://www.exeter.ac.uk/ug/careers)

# MODULES

Please note that availability of all modules is subject to timetabling constraints and that not all modules may be available every year. The optional modules below are just some of those open to Natural Sciences students; you may take any University science-based module providing you satisfy any necessary prerequisites and have not already taken the module or an equivalent.

For up-to-date details of all our programmes and modules, please check the undergraduate section of our website at [www.exeter.ac.uk/ug/natural-sciences](http://www.exeter.ac.uk/ug/natural-sciences)

## Year 1

### Core modules:

<b>Experimental Science</b>	This module will give you a broad foundation in experimental science, through laboratory sessions in biology, chemistry and physics, which you will build upon in stage 2 and your research project in subsequent years.
<b>Foundations in Natural Science</b>	You will develop core knowledge in biology, chemistry, physics, whilst at the same time exploring the links between them.
<b>Frontiers in Science I</b>	This module is core to the Natural Sciences ethos and will include student-led activities that will allow you to explore the science issues you find fascinating.
<b>Mathematics and Computing: Integrative Tools for Natural Sciences</b>	Provides you with the mathematical skills needed for a range of research areas. Computing is a fundamental part of modern science and you will be given an introduction to programming, together with an overview of developments in computer science.

## Year 2

### Core module:

<b>Frontiers in Science II</b>	At the core of the module is the practical, which spans the year: you will design, build, run and analyse experiments that will require elements of computer programming, physics, biology, chemistry and mathematical modelling. Modern apparatus and techniques used across Natural Sciences will be introduced and explained in a series of Exploring Frontiers lectures. Colloquia on hot topics in science will be given by international researchers at the forefront of their fields.
--------------------------------	--

### Optional modules:

<b>Advanced Cell Biology</b>	You will study a range of important cellular processes in depth, including intracellular transport, cell polarity, cell cycle regulation and cell migration.
<b>Analytical Techniques in Biochemistry</b>	Through lectures and practicals you will be introduced to the state-of-the-art methods used to analyse and characterise biological macromolecules.
<b>Biogeography and Ecosystems</b>	This module aims to provide an introduction to biogeography and ecosystem functioning concepts, to outline some of the most important environmental issues affecting the biosphere, and give an overview of the techniques used to quantify, monitor and predict changes in current ecosystem patterns and implications for the future of our planet.
<b>Bioinorganic Chemistry</b>	Provides a study of the processes of physical chemistry, redox reactions and bioinorganic chemistry. You then move on to study the role of metallochemistry in biology and medicine.
<b>Condensed Matter</b>	Develops your understanding of how electrons, and other waves, propagate within crystalline materials.
<b>Differential Equations</b>	Introduces some representative types of ordinary and partial differential equations and a number of analytical techniques used to solve them exactly or approximately.
<b>Ecology and Environment</b>	Develops your understanding of some of the fundamental concepts, methods and results in the scientific study of ecology, biodiversity and the environment. The module uses examples from both terrestrial and aquatic systems.

<b>Electromagnetism I</b>	Introduces the electromagnetic force that holds atoms, molecules and materials together and plays a vital role in our understanding of almost all existing and potential technological developments.
---------------------------	--

<b>Genomics and Introductory Bioinformatics</b>	This module focuses on state-of-the-art technology for analysis of genomes and gene expression and critically discusses their use in biological research and biotechnology. Practical classes consolidate use of internet-based genomics tools and will provide a platform to critically discuss case studies.
---	--

<b>Numerics and Optimisation</b>	Explores the use of computers to solve mathematical problems by means of numerical approximation. The techniques discussed form the basis of the numerical simulation and computer modelling of problems in science and business.
----------------------------------	---

<b>Observing the Universe</b>	Provides you with a basic understanding of the universe and its contents, and a good understanding of astrophysical measurement.
-------------------------------	--

<b>Physical Chemistry</b>	This module extends thermodynamics of chemical reactions to electrochemical reactions and other key processes. The statistical basis of thermodynamics is also elaborated and reaction mechanisms are expanded to encompass complex reactions. Quantum chemistry proceeds to semi-quantitative treatments of simple-harmonic motion and of the hydrogen atom.
---------------------------	---

<b>Physics of Living Systems</b>	Introduces the basic physical concepts and principles required to understand and study living systems. It starts at the molecular level and works up the scale of size and complexity to cover several major systems found in complex organisms.
----------------------------------	--

<b>Quantum Mechanics I</b>	Quantum mechanics is one of the fundamental building-blocks of physics. It affects profoundly the way we think about the universe and is the basis for much of condensed-matter, nuclear and statistical physics. This module introduces the basic principles of quantum mechanics and then applies these principles to atomic systems.
----------------------------	---

<b>Structure and Reactivity of Organic Compounds II</b>	Introduces the modern spectroscopic methods (infrared, ultraviolet and nuclear magnetic resonance spectroscopies and mass spectrometry), which are used for determining the structures of organic molecules. Reactions of compounds containing carbonyl groups will be explained, with an emphasis on formation of carbon-carbon bonds, as the key to the construction of the carbon skeletons of complex, biologically active compounds.
---	---

<b>Systems, Series and Transforms</b>	Looks at the mathematics of modern signal processing; the interplay between signals and series. It uncovers the mathematics which underpins the miniaturised digital revolution of the last couple of decades.
---------------------------------------	--

<b>Thermal Physics</b>	Develops the discussion of thermal properties into classical thermodynamics and shows how the laws of thermodynamics arise naturally from the statistical properties of an ensemble. Real-world examples of the key ideas are presented.
------------------------	--

# MODULES CONTINUED

## Year 3

### Core modules:

**Group Project** Requires you to work together in a group of between five and eight students and undertake a significant technical challenge. All projects are supervised by academic members of staff.

**Research Project** Project work provides the opportunity to carry out research and detailed investigation into a specific area linked to the University's science strategy themes. It develops your analytical and problem-solving skills in a context where you won't be told the 'right' answer; rather you must discover and validate an answer yourself.

## Year 4

### Core modules:

**Research Project** Based in one of our research groups, you will continue and develop the research project started in the third year.

**Research Project Extension** For those whose research is progressing well, this module provides an opportunity to extend the research with the aim of publishing your results in the scientific literature.

## Optional modules

There are a range of optional modules available in years 3 and 4. A selection of these modules can be found below:

**Bioinformatics** Analysis of the large datasets obtained in biological science and medical research requires a range of skills and knowledge drawn from computer science, physical sciences and mathematics and statistics as well as biological sciences. Bioinformatics is the discipline that integrates algorithms and methods from these disciplines to model biological systems and infer patterns hidden in complex data.

**Climate Change and its Impacts** This module is designed to give you an overview of climate change research. The module comprises a combination of lectures, supplemented by practical exercises (computer, data analysis, experimental lab), guest lecture(s) and written exercises, all to develop a range of skills in order to augment learning and to give you an exciting first-hand experience at running models used in climate change research.

**Dynamical Systems and Chaos** Provides you with a good understanding of asymptotic behaviour of nonlinear dynamics. You will be exposed to methods for dynamical systems, including nonlinear ordinary differential equations, maps and chaos.

**Energy Metabolism** This module aims to advance your knowledge of metabolic biochemistry by studying in detail the reactions in anaerobic energy metabolism, oxidative phosphorylation and photosynthesis, and appreciate how these reactions can lead to the generation of oxidative stress.

**Fluid Dynamics of Oceans and Atmospheres** This module lays the foundations for an understanding of large-scale weather patterns and ocean circulation. It will introduce you to the kinds of dynamics that can occur in stratified and rotating fluids, and introduce key concepts, such as conservation and balance, that are used to understand and analyse such flows.

**Frontiers in Molecular Cell Biology** In this module we will explore selected topics at the forefront of cell biology and you will be introduced to the range of experimental techniques that are used to investigate how cells function.

**Further Advanced Topics in Chemistry** In this module you will study a range of options covering the chemistry at the cutting edge of interdisciplinary research, from organic synthesis to electrochemistry, spectroscopic techniques and materials chemistry.

**Magnetic Fields and Fluid Flows** This module deals with the motion of electrically conducting fluids in the presence of magnetic fields, a subject known as magnetohydrodynamics (MHD). MHD flows play a crucial role in the dynamics of a variety of astrophysical systems (including stars, planets, accretion discs and galaxies).

**Mathematics of Climate Change** This module will provide a background in the mathematics underlying human-induced climate change. It will provide you with a good general understanding of the climate system, against which to assess the likely role of anthropogenic forcing factors. Topics of study will include observations of climate change, climate feedbacks and geoengineering.

**Mathematical Biology and Ecology** Provides an opportunity to learn how mathematics may be usefully employed in the biosciences to assess population and demographic phenomena. Some use of software will enable students to build and analyse models using real-world examples from nature.

**Metamaterials** In this module you will discover how new materials are being created and engineered, using physics, chemistry and biology, that have properties that are not found in nature.

**Nuclear and High Energy Particle Physics** This module is an introduction to nuclear and particle physics delivered as a series of lectures and integrated self-study packs presenting topics as a set of keynote areas forming the foundations of the subject.

**Organic Synthesis and Drug Design** In this module we show how the basic reactions covered in the first and second years can be applied to the synthesis of biologically important molecules such as pharmaceuticals. Methods for designing synthetic routes to these compounds will also be explained using case studies.

**Physical Methods in Biology and Medicine** This module will discuss principles and current techniques used for understanding biology at the cellular and molecular levels and the particular challenges arising in their application to living systems. In addition it will highlight some of the contributions these approaches can make to medicine and the life sciences.

**Stars** The study of stellar systems encompasses a wide range of physics, including gravitation, quantum mechanics and thermodynamics. This module takes these fundamental physical concepts and uses them to derive the properties of stars.

# ABOUT THE UNIVERSITY OF EXETER

Ranked in the top 100 universities in the world

---

Top 10 in all major UK league tables

---

7th in *The Times and The Sunday Times Good University Guide 2016*

---

Our teaching is inspired by our research, 82% of which was ranked as world-leading or internationally excellent in the 2014 Research Excellence Framework

---

Six months after graduation, 95% of our first degree graduates were in employment or further study (HESA 2013/14)
