**Tuesday 25<sup>th</sup> June, 2019.**

# Land use policy: Agricultural subsidies

- Worldwide agricultural subsidies are massive at nearly \$500billion per year (Worldwatch, 2014)
- This might double if input subsidies (e.g. cheap fuel) were added in.
- Within the EU the Common Agricultural Policy (CAP) has always been the largest single element of the EU budget, rising to 73% of all EU spending in 1985 and still representing 37% of that budget in 2017.
- Reform of the CAP is ongoing but slow. However, the UK Agriculture Bill 2019 proposes a radical *Public Money for Public Goods* approach with subsidies targeted to deliver environmental improvements (Bateman and Balmford, 2019)
- But spatial heterogeneity of land use, the natural environment and the distribution of population means that alternative targeting of subsidies will generate very different levels of positive and negative externalities
- So how subsidies be allocated?

# Comparing approaches to decision making

- Use the **MARKET** to allocate subsidies
  - Locations for land use change determined by value of subsidies relative to agricultural value.
- Use **EXPERT** determined scenarios to allocate subsidies
  - Locations for land use change determined by analysis of stakeholder responses.
- Use **VALUATIONS** of the benefits and costs of land use change to allocate subsidies
  - Locations for land use change determined by net benefits of change.
  - Natural and physical sciences combined with economic supply and demand to determine values
  - Consistent with Natural Capital Approach
